**Development of Seismic Design Method for Reinforced Concrete  
Two-Way Bridge Column Hinges**

Two-way hinges are commonly used in reinforced concrete (RC) highway bridge column base to eliminate column moment transfer to foundation, thus reducing the cost of the bridge foundation.

Although two-way hinges are common, there is very limited information regarding the seismic response and design of this type

of connection. The soundness of the details used in practice has not been adequately investigated. Currently, the shear capacity of the two-way hinges is determined using the shear friction method.

When subjected to lateral forces such as earthquake load, hinges are under a combination of axial load, shear, as well as a great deal of moment. Therefore, the shear transfer mechanism is different from

A preliminary step-by-step rational method has been proposed and is being evaluated based on test data. Five 1/3-scale highway RC bridge column specimens with two-way hinge details (THD-1

to THD-5) are being tested on a shake table. Several important parameters that affect the hinge and column performance are included in the

Specimen	Column Height (inch)	Column Diameter (inch)	Column Steel Ratio	Hinge Diameter (inch)	Hinge Steel Ratio	Area Ratio (A <sub>h</sub> /A <sub>c</sub> )	Axial Load (kips)	Axial Load Ratio (P/A <sub>col</sub> f <sub>c</sub> )	Key aspect
# THD-1	48"	16"	4.20%	10	1.0%	0.39	107	10.0%	High axial load, Low aspect ratio column.
# THD-2	64"	16"	3.88%	10	1.0%	0.39	60	6.0%	Low axial load, High aspect ratio column.
THD-3	48"	16"	1.40%	10	1.0%	0.39	107	10.0%	Low plastic shear demand, Column steel ratio = 1.4%
THD-4	48"	16"	1.50%	10	1.0%	0.39	7	0.70%	Nearly Zero axial load.
THD-5	48"	16"	3.0%	8	1.31%	0.25	107	10.0%	Smaller hinge, A <sub>hinge</sub> = 0.25A <sub>column</sub> .

the assumptions in the standard shear friction theory. The objective of the current study is to develop a reliable method and verify it through shake table simulation studies of large-scale bridge column models.

tests. Typical specimen detail drawing and test setup are shown in Figure 1 and Figure 2 (see page 2). The main aspects of these five specimens are summarized and presented in the table above.

estimate of the shear capacity. A comprehensive evaluation of the data will be conducted once the last column is tested, and the design method will be finalized. The new method will allow engineers to design two-way hinges with confidence and will result in safer and more reliable bridges.

Illustrative examples will be prepared to aid NDOT bridge engineers in design of future hinged bridge columns. For further information on the project, please contact Dr. M. Saiidi at (775) 784-4839 or via e-mail at [saiidi@unr.edu](mailto:saiidi@unr.edu)

Figure 3 shows one of the tests after the specimen failed at the hinge. A close up of the shear failure at the two-way hinge region is shown in Figure 4.

Four of the five specimens have been tested thus far and refinement of the design parameters has begun. The experimental results have shown that the proposed method provides a reasonable and conservative

## Product Evaluation Committee (PEC) Meeting Recap

### APPROVED

#### Specification Revision for Soil Stabilizers and Dust Palliatives

In the past, acceptance of soil stabilizers and dust palliatives was based on available information and vague criteria. Recently, the department placed a moratorium on acceptance of these products, so that Hydraulics Engineering can explore baseline characteristics of all dust palliatives and soil stabilizers listed in the QPL. The objective of the study was to determine whether the diversity in products listed in the QPL is beneficial to the department. This study demonstrated that currently employed minimum criteria are adequate for a broad range of products and that the diversity of the products is beneficial. Nevertheless, based on this study, criteria have been improved to include additional guidelines to assist in product evaluation. These additional aspects of acceptance criteria

include but are not limited to assessment of the following: (1) product's composition; (2) the pH values of a product in both diluted and concentrated forms; (3) product's effect on existing and new vegetation; (4) product's performance when it is washed off equipment both before and after it is dried or cured; (5) modes of degradation (photo, bio, chemical or other); and (6) product's impact on water quality and aquatic life if product enters a surface water body.

Also, the new Storm Water Quality Handbooks include a matrix showing properties of common soil stabilizers and dust palliatives and also specific requirements by type of material and guidelines for their application limitations. This information will be very helpful to the contractors by enabling them to select the best product

for each specific application. For example, for traffic areas, synthetic polymers and copolymers perform fairly well. The department also has used salts, magnesium chlorate and calcium chlorate. These products require about 30% humidity to be effective; however, such conditions would usually not exist in most of Nevada. For non-traffic areas, Clark County prefers gypsum products mixed with paper or wood mulch. These products may last up to 3 years if the treated area is not disturbed. The synthetic polymers and copolymers are also preferable products on non-traffic areas.

Additionally, since the department instituted a landscaping master plan, the Design Division has requested that the treated soils do not contain any sterilants that might prevent the growth or survival of newly installed vegetation.

### Recognition of NDOT Employees on AASHTO/TRB Committees/Panels

NDOT would like to recognize the following individuals and show appreciation for their work as the department's representatives on AASHTO and TRB committees/panels:

Mr. Dennis Baughman  
Ms. Sohila Bemanian  
Ms. Jan Christopherson

Mr. Kent Cooper  
Mr. Frank Csiga  
Mr. William C. Crawford Jr.

*(continued on page 4)*

(continued from page 3)

Mr. Bob Dimmick  
Mr. Fred Droes  
Mr. Ruedy Edgington  
Mr. Mark Elicegui  
Mr. Jeff Fontaine  
Mr. Benton Grissom  
Mr. Tie He  
Mr. Brian Hutchins  
Ms. Denise Marie Inda  
Mr. Daryl N. James  
Mr. Wayne Kinder  
Mr. Russ Law  
Mr. Scott Magruder

Mr. Rudy Malfabon  
Mr. James W. Mallery  
Ms. Susan Martinovich  
Ms. Heidi Mireles  
Mr. Richard J. Nelson  
Mr. Paul Saucedo  
Mr. Frank G. Taylor  
Mr. Darin Tedford  
Mr. Scott L. Thorson  
Mr. Dean C. Weitzel  
Mr. Donald "Ed" Wilson  
Ms. Masha Wilson  
Ms. Marilyn Yezek  
Mr. Richard J. Yeoman

Thank you for your continuing efforts and contributing work as AASHTO and TRB committee/panel members.

The Research Division administers the Department's research, development and technology transfer program and serves as the "clearing-house" for product evaluations

**Research and Technology Review**

Is published quarterly by the NDOT Research Division. Its purpose is to provide the latest information on the NDOT research activities including product evaluation and other pertinent research topics.
